Half-Wave Rectifier

- Basic Implementation

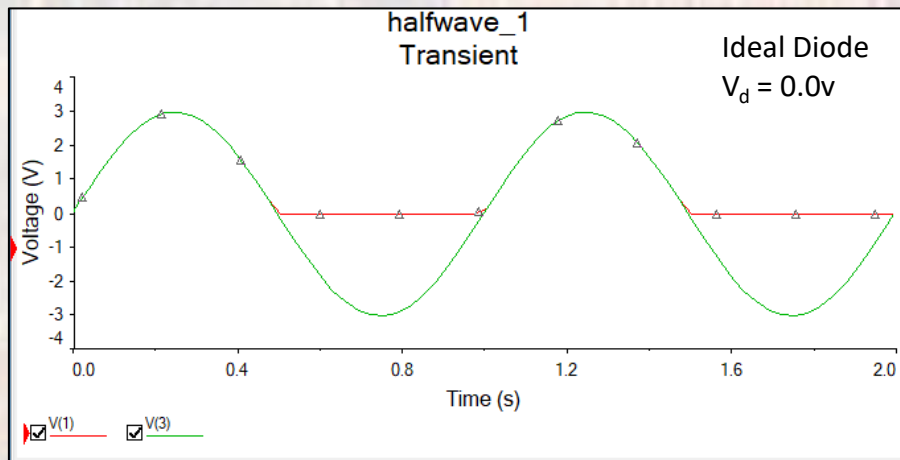

Half-Wave Rectifier

- Basic Implementation

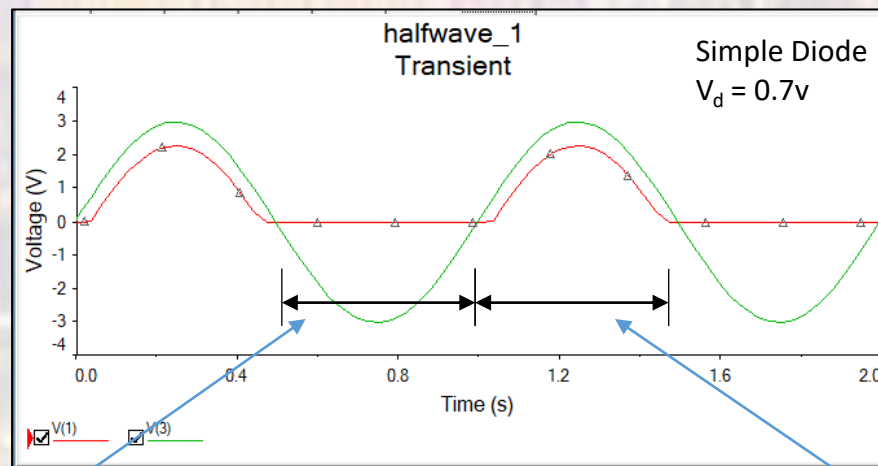

$$v_S = \pm 3V$$

Half-Wave Rectifier

- Design Considerations

Reversed biased region
 $v_{D\text{max}} = -v_{S\text{peak}}$
→ breakdown requirement

Forward biased region
 $i_{D\text{max}} = (v_{S\text{peak}} - v_D)/R$
→ current requirement

Half-Wave Rectifier

- Design Example

- 120v rms primary voltage
- Transformer turns ratio: 12
- Load resistance: 1K Ω

- What are the diode requirements?

Breakdown:

120v rms, 12 turns ratio $\rightarrow v_s = 10v$ rms

10v rms $\rightarrow v_{speak} = 14.14v$

Current:

$(14.14v - v_D)/1K\Omega \rightarrow 14.14ma - v_D/1K\Omega$

typical v_F is 0.6v $\rightarrow 13.54ma$

guard band the design:

$v_F \approx 0.6v$

$V_{breakdown} > 20v$ (14v rms)

$I_{max} > 20ma$
