

# Signed Binary Numbers

Last updated 10/3/24

These slides introduce signed binary numbers

# Signed Binary Numbers

- 3 variations of signed binary numbers
  - Sign-Magnitude
  - One's Complement
  - Two's Complement
- Two's complement is used in almost all digital systems
- We will use the names Two's Complement and Signed interchangeably

# Signed Binary Numbers

- Signed Binary (2's complement)
  - Binary representation for a number that can be positive or negative
    - Most data
  - Often just called “signed”
  - Characterized by n-bits
    - I have a 32 bit signed binary number

# Signed Binary Numbers

- Bit Values
  - The most significant bit is **NOT** used to represent the magnitude of the value
  - The most significant bit **INDICATES** the sign but is **NOT** a sign bit
  
- MSB = 0 → indicates a positive value
- MSB = 1 → indicates a negative value

# Signed Binary Numbers

- Number formation
  - **Positive** numbers are formed in normal binary format
    - Excluding the msb – it is not used to create the binary value
    - The msb will always be 0
  - **Negative** numbers are formed by
    - 1) Creating the positive binary number
    - 2) Flipping all bits and adding 1

# Signed Binary Numbers

- Binary Bit Values
  - **Excluding** the MSB

Note: we start counting bits at 0

Right to Left

bit #	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1	0	1	1	1	0	1	1	1	0	0	0	1	0	0	0	0	1	1	0	0	1	0	0	1	1	0	0	0	1	1	1
Value (2 <sup>bit #</sup> )	2,147,483,648	1,073,741,824	536,870,912	268,435,456	134,217,728	67,108,864	33,554,432	16,777,216	8,388,608	4,194,304	2,097,152	1,048,576	524,288	262,144	131,072	65,536	32,768	16,384	8,192	4,096	2,048	1,024	512	256	128	64	32	16	8	4	2	1

bit #	1	2	3	4	5	6	7	8
	1	0	0	0	0	0	1	0
Value (2 <sup>-bit #</sup> )	0.5	0.25	0.125	0.0625	0.03125	0.015625	0.0078125	0.00390625

Binary Point

Left to Right

# Signed Binary Numbers

- Convert Signed Binary to Decimal
  - Process:
    - If the MSB is 0 :
      - Convert the value to decimal using the positional conversion process used for unsigned binary conversion
    - If the MSB is 1 :
      - Write down the minus sign (so you don't forget)
      - Flip all the individual bits and add 1
      - Convert the value to decimal using the positional conversion process used for unsigned binary conversion

# Signed Binary Numbers

- Convert Signed Binary to Decimal

Convert signed binary **0011 0010** to decimal

MSB is 0 → positive → just calculate

0011 0010 →  $32 + 16 + 2 = 50$

Convert signed binary **1100 1110** to decimal

MSB is 1 → negative → write -, flip and add 1, calculate value

- minus sign

flip      0011 0001

add      +0000 0001

          0011 0010

calculate value

→  $32 + 16 + 2 = 50$

result: -50

# Signed Binary Numbers

- Convert Decimal to Signed Binary

- Process:

- If the decimal value is positive

- Convert the value to binary using the positional conversion process used for unsigned binary conversion, but exclude the MSB value, set it to 0

- If the decimal value is negative

- Convert the value to decimal using the positional conversion process used for unsigned binary conversion

- Flip all the individual bits and add 1

This is the opposite of  
converting signed binary  
to decimal

# Signed Binary Numbers

- Convert Decimal to Signed Binary

Convert 45 to 8-bit signed binary

Decimal is positive → just calculate but exclude the msb → 0

45	<del>0(128)</del>	45	45	13	13	5	1	1
		0(64)	1(32)	0(16)	1(8)	1(4)	0(2)	1(1)
45		45	13	13	5	1	1	0

Result: 0010 1101

Convert -45 to 8-bit signed binary

Decimal is negative → calculate value, flip and add 1

calculate value: 0010 1101 from above

flip	1101 0010
add	<u>+0000 0001</u>
	1101 0011

result: 1101 0011

# Signed Binary Numbers

- Word Length Extension - Sign Extension
- When extending to larger word sizes, extend the MSB to the left

4 bit	8 bit	16 bit
0110	→ 0000110	→ 000000000000110
1001	→ 11111001	→ 1111111111111001

# Signed Binary Numbers

- Limits
  - Maximum values:
    - 4 bits = +7, -8 =  $2^3-1, -2^3$
    - 8 bits = +127, -128 =  $2^7-1, -2^7$
    - 16 bits = +32,767, -32,768 =  $2^{15}-1, -2^{15}$
  - Not Symmetric

7	6	5	4	3	2	1	0	-1	-2	-3	-4	-5	-6	-7	-8
0111	0110	0101	0100	0011	0010	0001	0000	1111	1110	1101	1100	1011	1010	1001	1000

# Signed Binary Numbers

- Number Lines
  - Fixed size limitations on binary numbers causes the number line to wrap around

0111	7
+ 0001	1
1000	-8

01111111	127
+ 00000001	1
10000000	-128

0111111111111111	32767
+ 0000000000000001	1
1000000000000000	-32768

# Signed Binary Numbers

- 2's complement notation
  - Advantages
    - Addition is done the same way as unsigned numbers – same adder circuit
    - ONLY 1 ZERO !
    - Simple word length extension
  - Disadvantages
    - Asymmetric range
    - Harder to do comparisons
    - Not intuitive
