

If - Else

Last updated 8/31/21

If-Else

- Two way decisions

If-Else

- Two way decisions

- if ... else

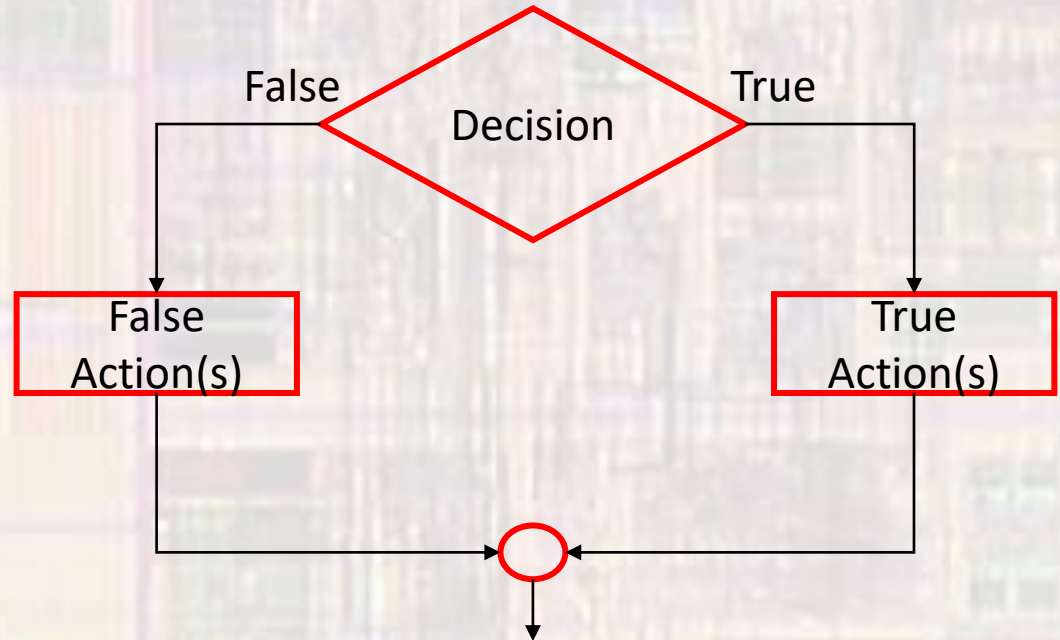

...

if (expression)
statement 1

else

statement 2

...

If-Else

- if - else – Rules

- 1) expression must be in parenthesis
- 2) no semicolon (unless statements need one)
- 3) expression can have side effects
- 4) statements can be anything – including another if-else
- 5) statement 1 and statement 2 must be a single statement – **but remember we can use {...} to combine multiple statements to be considered one statement**

If-Else

- Examples

```
if (j == 1)
    a++;
else
    a--;
```

```
if (j <= 5){
    a++;           // compound statement
    b = a + 3;
}
else
    a--;
```

If-Else

- Examples

```
if (j == 1)
    a++;
else
    ;
```

// null else statement

This may be clearer
in some cases

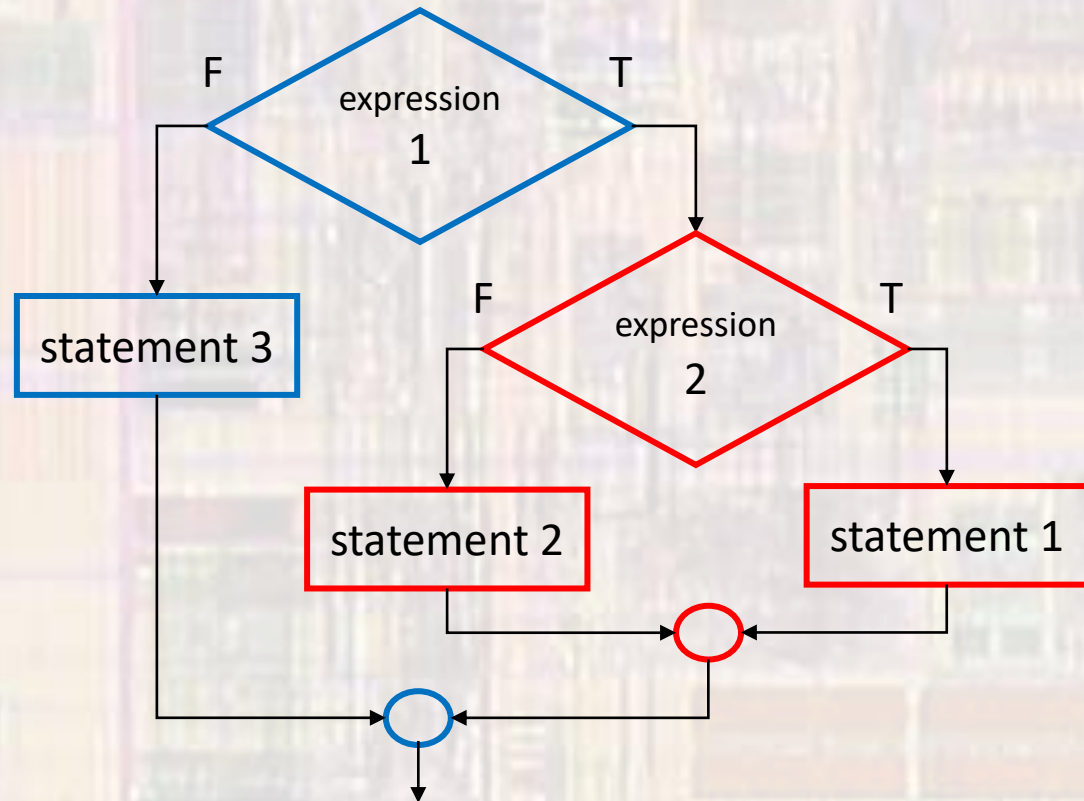

```
if (j <= 5){
    a++;
    b = a + 3;
}
```

// null else statement (nothing at all)

If-Else

- Nested if-else

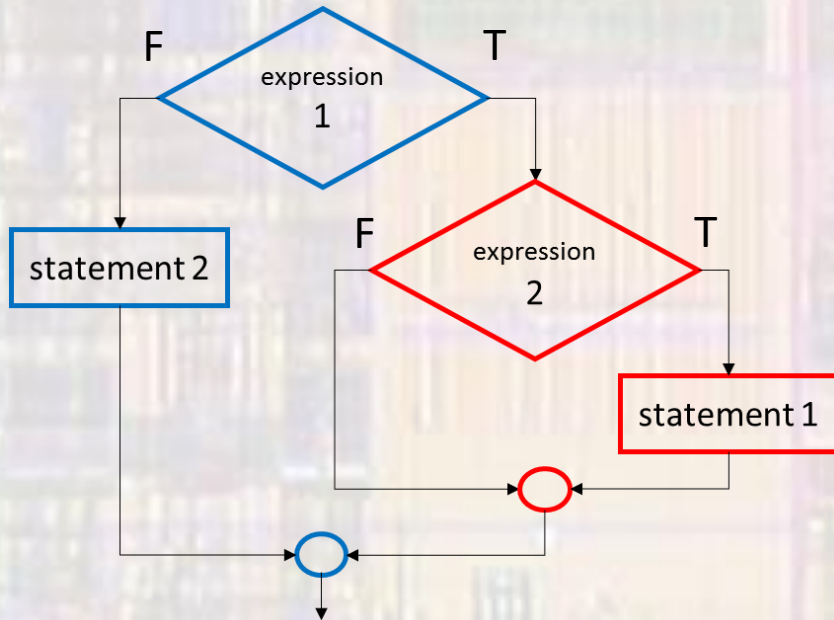

```
if (expression 1)
  if (expression 2)
    statement 1
  else
    statement 2
else
  statement 3
```

If-Else

- Nested if-else – possible error

Desired

Code Attempt

```
if (expression 1)
  if (expression 2)
    statement 1
else
  statement 2
```

Not what you expect

If-Else

- Nested if-else – possible error
 - **else is paired with the most recent if**

```
if (expression 1)  
  if (expression 2)  
    statement 1  
else  
  statement 2
```

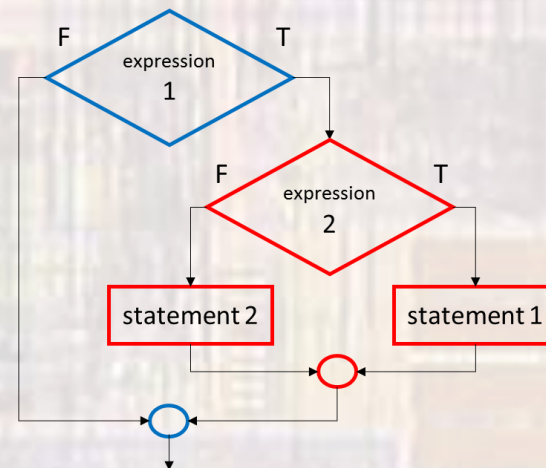

Indentation is for clarity
it has no effect

```
if (expression 1)  
  if (expression 2)  
    statement 1  
else →  
  statement 2
```

Desired →

Actual →

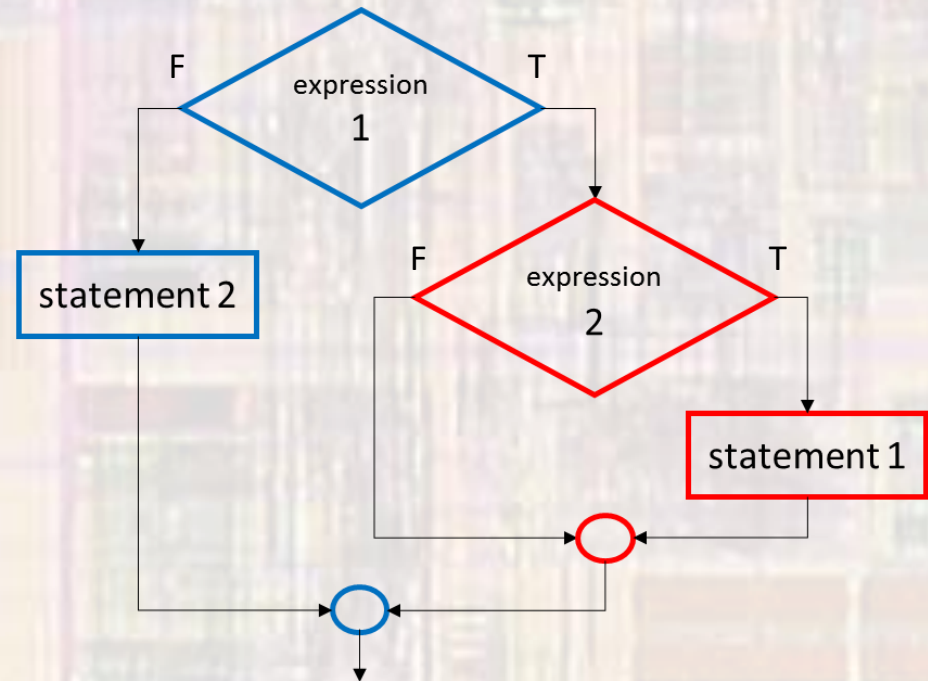

If-Else

- Nested if-else – correct structure
 - **else is paired with the most recent if**

```
if (expression 1)  
  if (expression 2)  
    statement 1  
  else  
  ;  
else  
statement 2
```

```
if (expression 1){  
  if (expression 2)  
    statement 1  
}  
else  
statement 2
```

If-Else

- Expression Examples

```
if (a < b){
```

```
if (!a){
```

```
if ((a - b) > 0){
```

```
if (myChar == 'a'){
```

```
if (a == 2){           // always do this
```

```
if (a = 0){           // arggggg, never do this
```

```
if (a == 0 || b && !c){
```

Some compilers will give you a warning – **others will not**

Either way the expression is still evaluated – in this example it has the value 0 (false)

If-Else

- Practice

- If myChar is the letter e (small or capital), make it the same capitalization but an f
- If a is positive, decrement it, otherwise increment it
- If either a or b are false, increment c, otherwise set c equal to 5
- Assume a and b are floats. If they are equal clear a.
This is actually very difficult to guarantee what you want
