Last updated 5/18/21

- Variable
 - Symbolic representation for a value name
 - Stored in memory (data)
 - Can be modified during execution
 - Since it requires space in memory it must have a type to tell the compiler how much space to reserve
 - Allowed characters: letters, numbers, _____
 - Cannot begin with a number

© ti

- Variable Declaration
 - Specify the type and name for a variable
 - Must be declared before it can be used

int foo; float rate; char initial1;

int var1, this, is, not, a, good, practice;

int AccountBalance; int annual_interest_rate;

** Note: name length has no impact on compiled program size focus on readable code

- Variable Initialization
 - Variables are not initialized just by declaring them
 - They do not automatically have a value of 0
 - They may well have garbage values

Nothing stops you from using an un-initialized variable

int foo = 23;

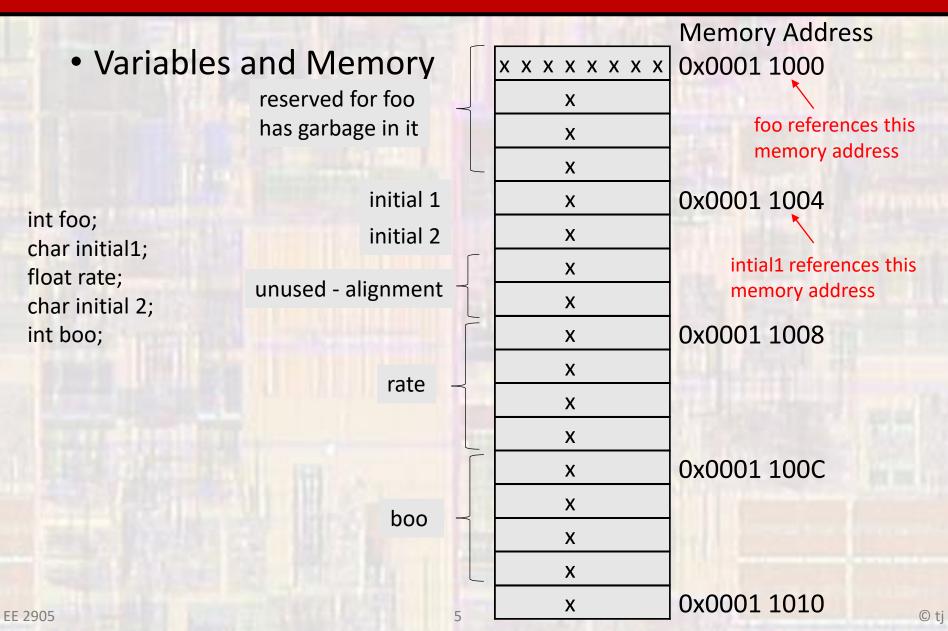

int count; count = 0;

char fx = 'A';

int foo, boo = 23;

int foo = 23, boo = 23;

float pie = 3.14159;

		- I Brins	Memory Address
Variables and Memory		x x x x x x x x x	0x0001 1000
reserved for foo		X	
<pre>int foo; char initial1; float rate; char initial 2; int boo; initial1 = 't'; rate = 2.5; boo = 255;</pre>	has garbage in it	X	foo references this
		X	memory address
	initial 1 – 't' – hex 0x74	01110100	0x0001 1004
	initial 2 - garbage	x	
	unused - alignment	x	intial1 references this
		x	memory address
	$2.5 \rightarrow 10.1 \text{ binary} \rightarrow \boxed{1.01 \text{ x } 2^1 \rightarrow 0 \text{ sign}}$	00000000	0x0001 1008
		00000000
