

Functions and Program Memory

Last updated 5/16/24

These slides show how functions work in program memory

Functions and Program Memory

- Functions and Memory - program memory
 - **Function call transfers execution to a separate section of code (function)**
 - **When done, the function returns to the next line of the calling function code**
 - Multiple calls to the same function transfer execution to the same location
 - Only one copy of the function in program memory
