

CS2910 Paper Quiz 3

Name:

Consider the following reassembled TCP stream containing bytes from the server to the client in an SMTP connection. (The bytes from the client to the server are not shown.)

```

```

1. (3 points) The client sends the server the command EHLO [155.92.72.102]. The server starts its response at byte index 00AE. **Write** the **index** of the **last** byte of the server's response. **Explain** how the client would determine this byte is the last byte.
2. (1 point) The client then sends the server the command STARTTLS. The server's next response is in reply to this command. **Write** the **index** of the last byte of this response.
3. (1 point) **Write** the name of the protocol the server will use to interpret the non-ASCII bytes in the lines starting with indexes 0150, 0160, and 0170.
4. (1 point) In modern email usage, there are two servers between the sending and receiving clients. **Write** the name of the protocol these servers use to communicate.
5. (1 point) In modern email usage, **write** the name of a protocol that a client can use to send email to a server.
6. (1 point) In modern email usage, **write** the name of a protocol that a client can use to receive email from a server.
7. (2 points) **Describe** the difference between SMTP over SSL/TLS and SMTP with STARTTLS.
